Introduction

Mobile phones come in all sorts of prices, features, specifications and all. Price estimation and prediction is an important part of consumer strategy. Deciding on the correct price of a product is very important for the market success of a product. A new product that has to be launched, must have the correct price so that consumers find it appropriate to buy the product.

Problem Statement

To predict the price range of a mobile phone. The data contains information regarding mobile phone features, specifications etc and their price range. The various features and information can be used to predict the price range of a mobile phone.

```
import libraries
import numpy as np
import pandas as pd
import seaborn as sns
import matplotlib.pylab as plt
%matplotlib inline
import warnings
warnings.filterwarnings('ignore')
```

Read data

data.price_range.value_counts()

```
data=pd.read csv(r"C:\Users\samee\Downloads\train data.csv")

21 rows × 21 columns

In [21]: plt.figure(figsize=(20,30)) heatmap=sns.heatmap(x,cmap="coolwarm",annot=True) plt.title("Heatmap for correlation") plt.show()

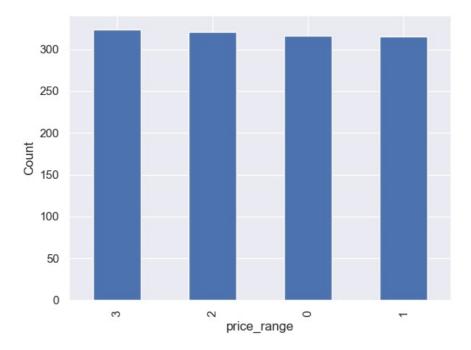

```
In [23]: sns.set()
    price_plot=mob_data_f['price_range'].value_counts().plot(kind='bar')
    plt.xlabel('price_range')
    plt.ylabel('Count')
    plt.show()
```

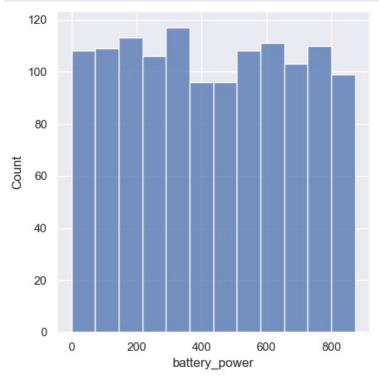

So, there are mobile phones in 4 price ranges. The number of elements is almost similar.

Data Distribution

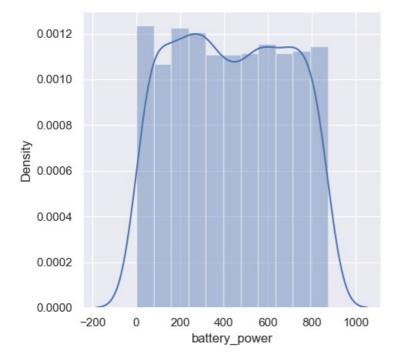

First, we see how the battery_power mAh is spread.

```
In [24]: sns.set(rc={'figure.figsize':(5,5)})
   ax=sns.displot(data=mob_data_f["battery_power"])
   plt.show()
```

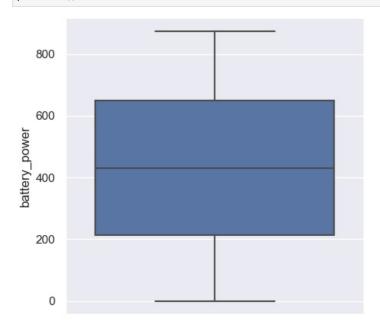

Now, we see the count of how many devices have Bluetooth and how many don't.

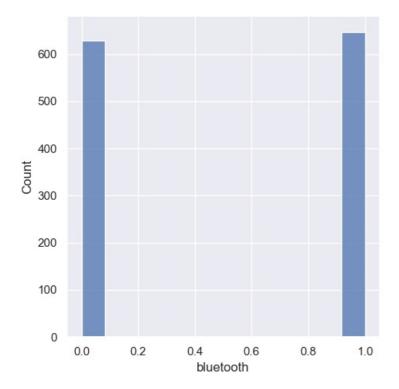

```
In [25]: sns.distplot(mob_data_f.battery_power)
plt.show()
```

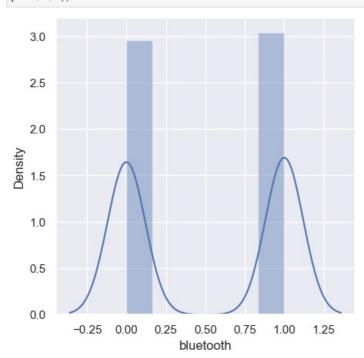

In [26]: sns.boxplot(data=mob_data_f,y='battery_power')
plt.show()

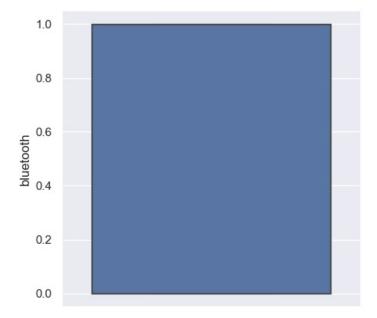

```
In [27]: sns.set(rc={'figure.figsize':(5,5)})
   ax=sns.displot(data=mob_data_f["bluetooth"])
   plt.show()
```

In [28]: sns.distplot(mob_data_f.bluetooth)
plt.show()

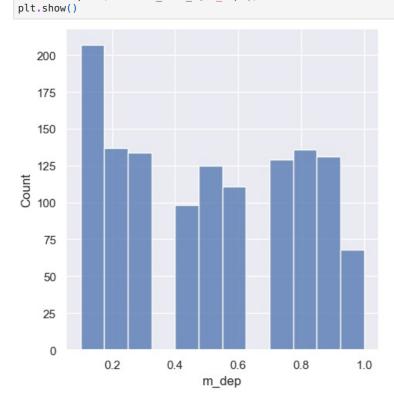

In [29]: sns.boxplot(data=mob_data_f,y='bluetooth')
plt.show()

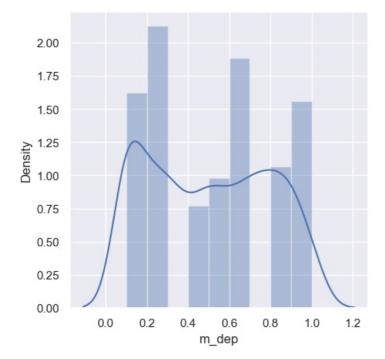

Next, we analyse the mobile depth (in cm).

```
In [30]: sns.set(rc={'figure.figsize':(5,5)})
ax=sns.displot(data=mob_data_f["m_dep"])
```

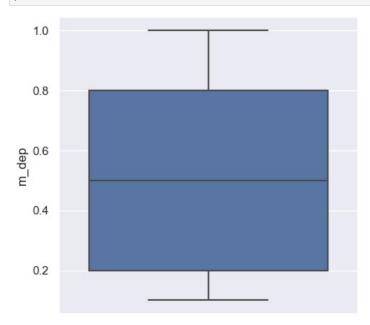

-----> A few mobiles are very thin and a few ones are almost a cm thick.

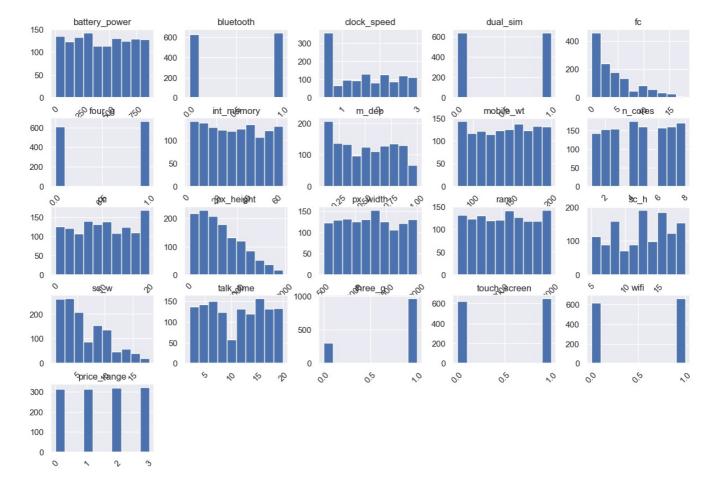

```
In [31]: sns.distplot(mob_data_f.m_dep)
plt.show()
```

In [32]: sns.boxplot(data=mob_data_f,y='m_dep')
plt.show()

In [33]: mob_data_f.hist(figsize=(15,10),xrot=45)
 plt.xticks(rotation=70)
 plt.show()

Creating Base Model

In a similar way, the data distribution can be analysed for all the data features. Implementing that will be very simple. Let us see if there are any missing values or missing data.

```
mob data f.shape
In [34]:
          (1276, 21)
Out[34]:
          x=mob data f.drop(['price range'], axis=1)
In [35]:
          y=mob_data_f['price_range']
          # missing values
          x.isna().any()
          battery_power
                            False
Out[35]:
          bluetooth
                            False
          clock_speed
                            False
                            False
          dual_sim
          fc
                            False
          four g
                            False

```

Split the data

```
In [66]: from sklearn.model_selection import train_test_split
x_train, x_test, y_train, y_test= train_test_split(x, y,test_size=0.2,random_state=7)
```

Now, we define a function for creating confusion matrix.

```
from sklearn.metrics import classification_report, confusion_matrix, accuracy_score
def my_confusion_matrix(y_test, y_pred, plt_title):
    cm=confusion_matrix(y_test, y_pred)
    print(classification_report(y_test, y_pred))
    sns.heatmap(cm, annot=True, fmt='g', cbar=False, cmap='BuPu')
    plt.xlabel('Predicted Values')
    plt.ylabel('Actual Values')
    plt.title(plt_title)
    plt.show()
    return cm
```

A random forest is a supervised machine learning method built from decision tree techniques. This algorithm is used to anticipate behaviour and results in a variety of sectors, including banking and e-commerce. A random forest is a machine learning approach for solving regression and classification issues. It makes use of ensemble learning, which is a technique that combines multiple classifiers to solve complicated problems. The Random Forest Algorithm based on Decision Tree Algorithm

2) SVM Classifier

Support Vector Machine, or SVM, is a prominent Supervised Learning technique that is used for both classification and regression issues. However, it is mostly utilised in Machine Learning for Classification purposes.

The SVM algorithm's purpose is to find the optimum line or decision boundary for categorising n-dimensional space so that we may simply place fresh data points in the proper category in the future. A hyperplane is the optimal choice boundary.

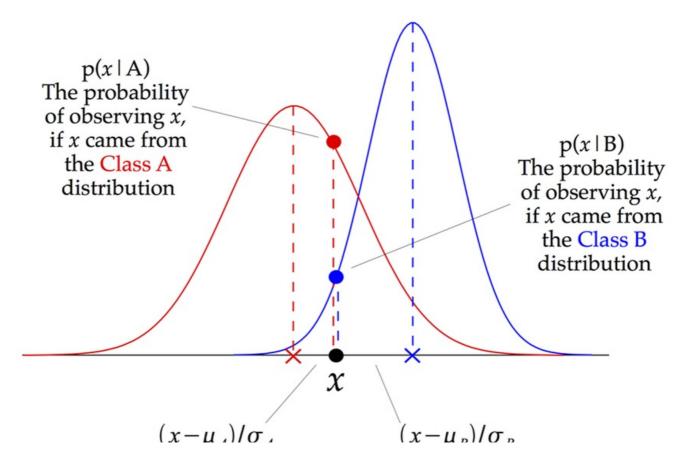

SVM Cla	ssifier Accu preci		Score: 0.80859375 recall f1-score		support
1 2		0.92 0.8 0.75 0.7 0.68 0.7 0.90 0.8		0.90 0.76 0.70 0.89	64 71 59 62
	5				256 256 256
		SVM Cor	nfusio	on Matrix	
0	56	8		0	0
Values 1	5	54		12	0
Actual Values 2	0	10		43	6
8	0	0		8	54
	0	1 Predic	ted V	2 /alues	3

We can see that the SVM classifier is giving the best accuracy.

3) Naive Bayes

Conditional probability is the foundation of Bayes' theorem. The conditional probability aids us in assessing the likelihood of something occurring if something else has previously occurred. Gaussian Naive Bayes is a Naive Bayes variation that allows continuous data and follows the Gaussian normal distribution.

                                                              0.90
                                                                              62
                                                                            256
                                                              0.80
                 accuracy
               macro avg
                                    0.81
                                                 0.81
                                                              0.81
                                                                            256
            weighted avg
                                    0.81
                                                 0.80
                                                              0.81
```

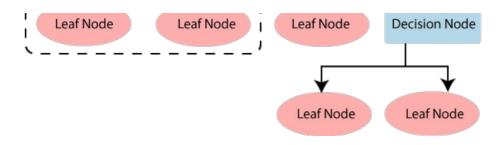

We can see that the model is performing well.

4) Decision Tree Classifier

The decision tree classifier creates the classification model by building a decision tree. Each node in the tree specifies a test on an attribute, each branch descending from that node corresponds to one of the possible values for that attribute.

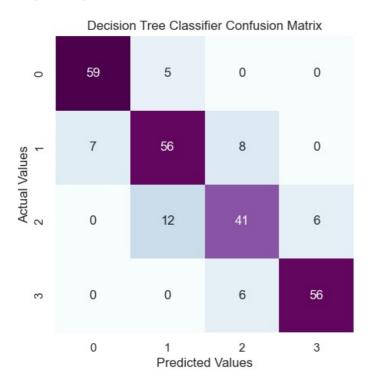

```
In [57]: from sklearn.tree import DecisionTreeClassifier
dtc = DecisionTreeClassifier()
dtc.fit(x_train,y_train)
```

Out[57]: v DecisionTreeClassifier
DecisionTreeClassifier()

```
In [59]: y_pred_dtc = dtc.predict(x_test)
```

In [60]: print('Decision Tree Classifier Accuracy Score: ',accuracy_score(y_test,y_pred_dtc))
 cm_dtc=my_confusion_matrix(y_test, y_pred_dtc, 'Decision Tree Classifier Confusion Matrix')

Decision	Tree	Classifier	Accuracy	Score: 0	.828125

macro	,	0.83	0.83	0.83	256
weighted	_	0.83	0.83	0.83	256

Conclusion

In this problem, we looked at classification. Classifiers represent the intersection of advanced machine theory and practical application. These algorithms are more than just a sorting mechanism for organizing unlabeled data instances into distinct groupings. Classifiers include a unique set of dynamic rules that include an interpretation mechanism for dealing with ambiguous or unknown values, all of which are suited to the kind of inputs being analysed. Most classifiers also utilize probability estimates, which enable end-users to adjust data categorization using utility functions.

In this problem, we see that SVM Classifier is perform well than other models.
